MyLab Quality simulation · team tally sheet

Session 4 · one simulated year as a restaurant manager · Team code name: _____ · fill it in **while you play**; you type it into Colab Part 3 afterwards

Before you start: read the feedback first, sort it, then invest. The simulation scores profit and reviews; your Colab lab scores whether your money went where the feedback pointed. Keep this sheet next to the laptop.

A · Feedback by category (tally every piece of feedback you read)

Category (use the simulation's own labels)	Tally	Count
Slow service		
Wrong order		
Cold food		
Staff attitude		
Cleanliness		
Price / value		
Other: _____		
Other: _____		
Total		

Staff feedback counts too: write it as the cause it points to.

B · Investments you chose

Investment	Cost	P / A / F	Addresses which cause

P = prevention (stops the fault), A = appraisal (checks), F = failure (refunds, comps, lost customers – what poor quality cost you; the simulation's own number if it shows one, otherwise your estimate).

C · The year, month by month

Month	1	2	3	4	5	6	7	8	9	10	11	12
Complaints (or negative reviews)												
Guests / orders / all reviews (n)												
Investment made this month? (✓)												

If the simulation shows only a running review score, write the score per month in row 1 and leave row 2 empty; Colab then uses negative reviews as defectives and all reviews as n.

D · Result

Final profit	Final review score	Rank in the room	One sentence: the best decision we made

Pearson MyLab Operations Management, Quality Management simulation (restaurant manager, one simulated year). Category names are placeholders: use the simulation's own labels. Eigene Darstellung, R. Bartnik 2026; built with Claude (Anthropic).
